

KLINIDERM - Silicone Wound Contactlayer

Description

Soft silicone wound contact layer with porous structure that allows exudate to pass into a secondary absorbent dressing. Sealing of the wound edges minimizes the risk of maceration. One-sided silicone layer makes the dressing easy to use and prevents the secondary dressing from sticking to the wound contact layer. Medical device. Sterile if pouch and seal are intact.

Product information

In compliance with: MDD (EU) 93/42/EEC Class IIb
